I'm a curious and collaborative graduate student interested in solution consulting and solving customer business problems. I combine a design background with AI development and data analysis to translate user needs into practical solutions. My experience includes customer-facing AI workflows, client demos, and business reporting. I enjoy clarifying requirements, explaining technical ideas, and working across teams to refine solutions around customer feedback and measurable business value.

Available June 2027

EDUCATION

Cornell University — Ithaca, NY
Master of Computation and Information Science | Data Science Track — *Expected May 2027*

Parsons School of Design, The New School — New York City, NY
Bachelor of Fine Arts in Interior Design | Coursework in Data Science — *Sep 2022 – May 2026*

- GPA 3.78/4.00

EXPERIENCE

Google | Capstone project — Ithaca, NY
Product Manager — *Fall 2026*

- Developed a Python toolkit spanning 10 causal inference methods to help the client evaluate business outcomes, reducing the time needed to produce analytical results by 60%.
- Built a method recommendation system that helps users navigate analytical options and select an appropriate approach, translating technical complexity into a more accessible workflow.
- Building controlled evaluation datasets and documenting methods and APIs to help users understand toolkit capabilities, interpret results, and integrate the solution into their workflows.

Lenovo SSG — Beijing, China
AI Engineer Intern — *Jun 2026 – Aug 2026*

- Translated customer restocking needs into a Python AI inventory-monitoring solution, achieving 90% shelf-status detection accuracy across 10K images and videos and improving restocking speed and accuracy by 30%.
- Used AI tools to build prototypes and client demos, gathering feedback and iterating on the inventory workflow to connect visual detections with reports and restocking recommendations for store employees.
- Designed a cloud solution combining RF-DETR, vision-language models, and FFmpeg live stream processing for race car identification across 3K+ clips; recommended smaller server-side models to help reduce client costs by 30%.

Hanshow Technology — Beijing, China
Product Data Analyst Intern — *Jun 2025 – Aug 2025*

- Led A/B testing and user-intent analysis for retail search improvements, increasing click-through rate by 12% and translating results into recommendations for product and business stakeholders.
- Analyzed 100K+ interaction records to identify customer intent and drop-off points, informing priorities for product improvements.
- Partnered with product, engineering, and business teams to translate user behavior findings into solution recommendations and align feature decisions with customer needs and measurable outcomes.
- Built SQL/Python reporting pipelines for engagement, conversion, and retention KPIs, reducing manual analysis time by 30%.
- Built a Power BI dashboard and analyzed 30K customer records to make business insights accessible to stakeholders.

SKILLS

Consulting & Product: Requirements Analysis, Solution Design, Prototyping, Client Demos, Cross-Functional Collaboration
Business & Analytics: Business Intelligence, Customer Insights, KPI Reporting, A/B Testing, Project Management
Technical Tools: SQL, Python, Power BI, Tableau, Excel, Figma, Pandas, R, Databricks, LangChain, Ollama, Git/GitHub
Language: Fluent in English and Mandarin

TECHNICAL PROJECT

Digital Twin AI Agent System — *2026*

- Building a digital twin of a social platform with simulated users, posts, and group chats to model how scam links spread and how coordinated harassment unfolds.
- Testing safety interventions (forwarding limits, warning prompts, easier reporting) against a baseline with no new safeguards.
- Measuring impact and trade-offs against three pilot targets: 30% fewer users exposed to harmful content, 25% faster median detection, and under 5% of legitimate interactions incorrectly blocked. These are simulation targets, not measured results.

Smart Planter — *2026*

- Developed an IoT smart planter that uses real-time humidity and temperature sensor data to predict optimal watering schedules.
- Applied Random Forest and XGBoost to watering predictions, achieving 90%+ prediction accuracy.

Classroom Activity Insights | Live Video Analytics Prototype — *2025*

- Designed a prototype combining RF-DETR for bounding box detection and segmentation with VLMs to identify observable student activities in live classroom footage, targeting 90% detection accuracy.
- Used LLMs to summarize participation metrics in visual dashboard reports, helping teachers review activity patterns and identify opportunities for student support.
